

Comprehensive Transportation Plan - Evermore Community Improvement District | Snellville, Georgia

Axis was prime consultant for the development of the Comprehensive Transportation Plan (CTP) for the Evermore Community Improvement District (CID). The CID extends six and a half miles along US 78 from Park Place Blvd. to Wisteria Dr./Skyland Dr.

Within the study area, the corridor carries between 55,000 and 65,000 vehicles per day. The CTP identified how a community would like to see its transportation networks develop to serve its current and future needs. The Plan also documented existing transportation conditions, identified needs and objectives, and developed recommendations for transportation improvements to maintain and expand the CID's infrastructure while fostering a healthy, livable community.

The CTP included numerous transportation recommendations to address the specific needs identified in the study. The consultant team developed 46 projects, which include intersection improvements, roadways (new and widenings), bridge, pedestrian and bicycle facilities, transit recommendations and others.

The plan developed project recommendations based on previously identified needs, stakeholder input, and traffic analysis of intersection conditions along US 78. An evaluation of the projects was performed to indicate the potential benefits. Planning level cost estimates were developed for most of the roadway and intersection projects (some projects require further evaluation). The projects were categorized as short-term, mid-term, and long-term improvements.
